August 24 - 28, 2012, Latvia

- LT international migration
- Portrait of immigrant
- Estimation characteristics of immigrants (EU-SILC)
- Simulation study

LT data summary

International migration flows

¹ In 2004–2009, the number of emigrants has been estimated based on the data of the declaration of the place of residence and the results of the Survey on Undeclared Emigration, in 2010–2011 – by data of the declaration of the place of residence.

Definition

Immigration is the arrival in a country from another country with the intention to take up permanent residence, or for a period longer than 12 months.

The Portrait of Immigrant, 2011.

- 15.6 thousand persons immigrated to Lithuania.
- 89 per cent of the total number of immigrants (or 14 thousand persons) returned to Lithuania were citizens of Republic of Lithuania.
- The same percent of women and men immigrated.
- Majority (71 per cent) of returning emigrants were citizens of Republic of Lithuania aged 20-39.
- Almost half persons of immigrants were coming back from UK, Ireland, Norway.

Sources of estimation migration

- Population register
- LFS
- EU-SILC

More characteristics of immigrants

- Employment status. (Source: LFS)

- Education. (Source: LFS)

- Quality of life. Social inclusion. (Source: EU-SILC)

Simulation study

- Artificial Population is the modified EU-SILC sample 2010.
- Population size is about 255 thous. persons.
- Simple random stratified sample is used. 7 strata are used.
- Sample size is 2000.
- Replication number is $M = 1000$.

Estimated variables

Variables of interest:

- Permanent residents (Res);
- Immigrants, who immigrated before year 2000 (Imm1);
- Immigrants, who immigrated between period 2001-2010 (Imm2);
- Mean disposable income;
- Poverty rate.

Breakdowns:

- Strata: 1,...,7;
- Employment status: employed, non-employed;
- Educational level.

Estimation methods

- Horvitz-Thompson Estimator (HT).
- Generalized Regression Estimator (GREG-1).
Auxiliary variables: number of person by sex-age groups in strata.
- Generalized Regression Estimator (GREG-2).
Auxiliary variables: number of person by age groups in strata, number of immigrants by age groups.

Quality measures of estimators

- Absolute relative bias ARB

$$ARB(\hat{t}_d) = \frac{\left| \frac{1}{M} \sum_{m=1}^M \hat{t}_d - t_d \right|}{t_d}$$

- Relative root mean squared error $RRMSE$

$$RRMSE(\hat{t}_d) = \sqrt{\frac{\frac{1}{M} \sum_{m=1}^M (\hat{t}_d^m - t_d)^2}{t_d}}$$
